Abstract:

A conference room booking system that allows you to book the right conference room to boost business and productivity. The system will allow you to book from various types of rooms for working groups of different sizes and varied time slots.

This system will be built using PHP and MySQL, PHP will be used to build the dynamic front end while MySQL will be the relational Database used. PHP is quite a robust scripting framework that can be used to build server side and function rich frontends with ease.

Users will be able to book real time and complete payments and receive confirmations via the system.

The main focus of the project is convenience, focussing on providing the best booking experience and customer service to people looking to make the best use of their work hours.
